

SLIMSPEC™

Professional System for Cellulite & Body Firming Treatments Based on Acoustic Radial Wave Therapy (ARWT)

Medispec Ltd. specializing in the development of Shock Wave Therapy based medical equipment, developed the Slimspec™ - an Acoustic Radial Wave Therapy (ARWT) aesthetic system for cellulite & body firming treatments.

Slimspec treatments can be performed on the cellulite affected areas such as the abdomen, hips, thighs or buttocks.

Slimspec is an easy to operate, compact and user friendly system. It is reliable and efficient, granting significant clinical results and great satisfaction to the customers.

- Gradual smoothening of skin surface with visible results
- Increased firmness & lifting of the skin
- Long-lasting treatment effect (up to 6 months post treatment)
- Painless & non-invasive treatment with no reported side effects
- No downtime after treatment
- Complies with international standards (FDA, CE)

Acoustic Radial Waves Technology (ARWT)

Acoustic radial waves are unfocused low pressure acoustic waves created by an electromagnetic ballistic mechanism. The wave is transferred into the tissue affecting a large treatment area. Lately it was successfully adapted to the clinical requirements for cellulite therapy, by allowing an excellent coverage of the cellulite area.

Applications

- Cellulite treatment
- Body firming
- Muscle toning
- Deep tissue massage
- Lymphatic drainage
- Treatment of stretch marks
- Skin elasticity improvement

How does Slimspec Work?

The treatment generates an instant reaction of a butterfly-like effect. The body responds to the acoustic radial wave by increasing metabolic activity around the site of the treated area. The acoustic radial waves reduce the tissue oedema which is one of the initial phenomena of the cellulite. Reduction of oedema causes less puffiness of the skin. The tissue becomes more permeable so the fluids and the toxins retained within the fat cells are being released and drained by the lymphatic system. By reducing the toxins, through reduction of oedema, there is less damage to the collagen fibers, thus, less degeneration and tighter holding of the skin.
